(b) Guided Transmission Media:

It is the transfer of data between the source end and destination end through physical means. The data is guided throughout the process.

There are three types of Guided transmission media:

- \* ~~Unshielded~~ Unshielded Transmission media.
- \* Shielded Transmission media.
- \* Fibre Optics.

Unshielded Transmission Media: In this media the wires used are twisted copper wires with a copper mesh covering. These twists cause the information to travel longer and slows the knowledge transmission speed.

\* It is cheap.
