DEPARTMENT OF ELECTRICAL AND ELECTRONCS ENGINEERING

Empowering youth- Architects of Future World

## VISION

To produce ethical, socially conscious and innovative professionals who would contribute to sustainable technological development of the society.

## MISSION

To impart quality engineering education with latest technological developments and interdisciplinary skills to make students succeed in professional practice.

To encourage research culture among faculty and students by establishing state of art laboratories and exposing them to modern industrial and organizational practices.

To inculcate humane qualities like environmental consciousness, leadership, social values, professional ethics and engage in independent and lifelong learning for sustainable contribution to the society.

## Prepared <br> By

Mr. N. Nireekshan,
Assistant Professor

METHODIST
COLLEGE OF ENGINEERING \& TECHNOLOGY

# DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING 

## VISION

To become a reputed centre for imparting quality education in Electrical and Electronics Engineering with human values, ethics and social responsibility.

## MISSION

- To impart fundamental knowledge of Electrical, Electronics and Computational Technology.
- To develop professional skills through hands-on experience aligned to industry needs.
- To undertake research in sunrise areas of Electrical and Electronics Engineering.
- To motivate and facilitate individual and team activities to enhance personality skills.

METHODIST
COLLEGE OF ENGINEERING \& TECHNOLOGY
(An UGC Autonomous Institution)
Approved by AICTE, New Delhi \& Affiliated to Osmania University Accredited by NBA and NAAC with A+

## DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING PROGRAM EDUCATIONAL OBJECTIVES

BE-Electrical Engineering graduates shall be able to:

- PEO1. Utilize domain knowledge required for analyzing and resolving practical Electrical Engineering problems.
- PEO2.Willing to undertake inter-disciplinary projects, demonstrate the professional skills and flair for investigation.
- PEO3. Imbibe the state of the art technologies in the ever transforming technical scenario.
- PEO4. Exhibit social and professional ethics for sustainable development of the society.

METHODIST
COLLEGE OF ENGINEERING \& TECHNOLOGY

# DEPARTMENT OF ELECTRICAL AND ELCTRONICS ENGINEERING 

## PROGRAM OUTCOMES

Engineering Graduates will have ability to:

- PO1. Engineering knowledge: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of electrical and electronics engineering problems.
- PO2. Problem analysis: Identify, formulate, review research literature, and analyze complex electrical and electronics engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
- PO3. Design/development of solutions: Design solutions for complex electrical and electronics engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- PO4. Conduct investigations of complex problems: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
- PO5. Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modelling to complex electrical and electronics engineering activities with an understanding of the limitations.
- PO6. The engineer and society: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional electrical and electronics engineering practice.
- PO7. Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- PO.8 Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the electrical and electronics engineering practice.
- PO9. Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- PO10. Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- PO11. Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- PO12. Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

## PROGRAM SPECIFIC OUTCOMES

At the end of BE program Electrical and Electronics Engineering graduates will be able to:

- PSO1.Provide effective solutions in the fields of Power Electronics, Power Systems and Electrical Machines using MATLAB/MULTISIM.
- PSO2. Design and Develop various Electrical and Electronics Systems, particularly Renewable Energy Systems.
- PSO3. Demonstrate the overall knowledge and contribute for the betterment of the society.

## LABORATORY CODE OF CONDUCT

1. Students should report to the labs concerned as per the scheduled time table.
2. Students, who report late to the labs will not be permitted to perform the experiment scheduled for the day.
3. Students to bring a 100 pages note book to enter the readings /observations while performing the experiment.
4. After completion of the experiment, certification of the staff in-charge concerned, in the observation book is necessary.
5. Staff member in-charge shall evaluate for 25 marks, each experiment, based on continuous evaluation which will be entered in the continuous internal evaluation sheet.
6. The record of observations, along with the detailed procedure of the experiment performed in the immediate previous session should be submitted for certification by the staff member in-charge.
7. Not more than three students in a group would be permitted to perform the experiment on the equipment-based lab set up. However only one student is permitted per computer system for computerbased labs.
8. The group-wise division made at the start of the semester should be adhered to, and no mix up with any other group would be allowed.
9. The components required, pertaining to the experiment should be collected from the stores in-charge, after duly filling in the requisition form / log register.
10. After the completion of the experiment, students should disconnect the setup made by them, and return all the components / instruments taken for the purpose, in order.
11. Any damage of the equipment or burn-out of components will be charged at cost as a penalty or the total group of students would be dismissed from the lab for the semester/year.
12. Students should be present in the lab for the total time duration, as scheduled.
13. Students are required to prepare thoroughly, before coming to Laboratory to perform the experiment.
14. Procedure sheets / data sheets provided to the students, if any, should be maintained neatly and returned after the completion of the experiment.

# DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING 

## DOS AND DON＇TS IN THE LABORATORY

Dos：
－All bags must be left at the place indicated
－There must be at least two people in the laboratory while working on live circuits．
－Shoes and apron must be worn at all times while in the laboratory．
－Consider all circuits to be＂HOT＂unless proven otherwise．
－When making measurements，form the habit of using only one hand at a time．
－Be as neat a possible．Keep the work area and workbench clear of items not used in the experiment．
－Always check to see that the power switch is OFF before plugging into the outlet．Also，turn instrument or equipment OFF before unplugging from the outlet．
－When disassembling a circuit，first remove the source of power．
－The lab timetable must be followed strictly．
－Be PUNCTUAL for your laboratory session．
－Experiment must be completed within the given time．
－Noise must be kept to a minimum．
－Handle all apparatus with care．

## Don＇ts；

－No part of a live circuit should be touched by the bare hand．
－No ungrounded electrical or electronic apparatus is to be used in the laboratory unless it is double insulated or battery operated．
－When unplugging a power cord，pull on the plug，not on the cable．
－Students are strictly PROHIBITED from taking out any items from the laboratory．

## Before Leaving Lab：

－Place the seating stools under the lab bench．
－Turn off the power to all instruments．
－Return all the equipment to lab assistant．
－Turn off the main power switch to the lab bench．
－Please check the laboratory notice board regularly for updates．

## Locus diagrams of RC and RL Circuits.

## AIM :

To Plot the current locus diagrams for RL and RC circuits.

## APPARATUS:

1. Resistance Box
2. Inductance Box
3. Capacitance Box
4. Ammeter AC -- (0-20mA) --- 1 No
5. Volt meters AC -- (0-20V) --- 2 No.s
6. Function Generator
7. CRO

## THEORY:

Locus diagrams are useful in determining the behaviour or response of an RLC circuit, when one of its parameters is varied while the frequency and voltage are kept constant. The magnitude and phase of the current vector in the circuit depend upon the values of $R, L$ and $C$ and frequency at the fixed source voltage. The path travelled by the tip of the current vector when the parameters $R, L$ or $C$ are varied while frequency and voltage are kept constant is called the locus diagram.

## R-varying :

If $R=0$, then $I=V / X$ or $V / X c$ and has maximum value. It will lag or lead the voltage by 90 depending on whether the reactance is inductive or capacitive. The angle $\theta$ represents the phase angle $\left(\theta=\tan -1\left(V_{x} / V_{R}\right)\right)$. As $R$ is increased from zero value, I and $\theta$ decrease. In the limiting case when $R=\infty$, then $I=0$ and $\theta=0$. The locus of end-point qitl is a semi-circle of radius $V / X$.

## R-Fixed :

If $X=0$, then $I=V / R$ and has maximum value. The current will be in phase with voltage as it is a purely resistive circuit i.e., the phase $\theta$ is zero. As $X$ is increased depending on whether the reactance is inductance or apacitance the current starts lagging or leading V i.e., the current I decreases and phase angle $\theta$ increases. In the limiting case when $X=\infty$, then $I=0$ and $\theta=90$. The locus of end point of $I$ is a semi-circle of radius $V / R$.

## CIRCUIT DIAGRAM :

CIRCUIT - 1

## PROCEDURE :

Circuit-1:

1. Connect the circuit as shown in CIRCUIT - 1. Note down the values of applied voltage and frequency.
2. Fix the resistance at a suitable value (say $1 K \Omega$ ).
3. Note down the values of $V_{R}, V_{c}$ and I for at least three different values of the Capacitor.
4. Now fix the capacitance at a suitable value (say $0.01 \mu \mathrm{~F}$ ).
5. Note down the values of $\mathrm{V}_{\mathrm{R}}, \mathrm{V}_{\mathrm{c}}$ and I for at least three different values of the resistor.
6. Draw the corresponding current locus diagrams.

## Circuit-2 :

1. Connect the circuit as shown in CIRCUIT - 2. Note down the values of applied voltage and frequency.
2. Fix the resistance at a suitable value (say $1 \mathrm{~K} \Omega$ ).
3. Note down the values of $V_{R}, V_{L}$ and $I$ at least three different values of the Inductor.
4. Now fix the Inductance value at a suitable value (say 45 mH ).
5. Note down the values of $\mathrm{V}_{\mathrm{R}}, \mathrm{V}_{\mathrm{L}}$ and I at least three different values of the resistor.
6. Draw the corresponding current locus diagrams.

## THEORY

An AC circuit is said to be in Resonance when the applied voltage and current are in phase.
Resonance circuits are formed by the combination of reactive elements connected in either series or parallel.

Resonance frequency in series circuit is given by $\mathrm{fr}=1 /(2 \pi \mathrm{VLC}) \mathrm{Hz}$
The impedance of the RLC circuit is
$Z=R+j(\omega L-1 / \omega c)=R+j X$
The circuit is in resonance when $\mathrm{X}=0$ ie., when $\omega \mathrm{L}=1 / \Omega \mathrm{c}$
In series RLC circuit the current lags behind or leads the applied voltage depending upon the value of $X_{L}$ and $X_{c}$. When $X_{L}$ is greater than $X_{c}$ the circuit is inductive and when $X_{c}$ is greater than $X_{L}$, the circuit is capacitive.

Quality factor ( Q-factor) or (Selectivity):
Quality factor can be defined as,
$=2 \pi$ (maximum energy stored $) /($ energy dissipated per cycle).
$=\left(f_{2}-f_{1}\right) / f_{r}$
Band width: Band width of a resonance circuit is defined as the band of frequencies on either sides of resonance frequency. This frequency range can be obtained by dropping a vertical in the graph at its half power value, i.e., $1 / \sqrt{ } 2$ times of maximum value.

Band width $=f_{2}-f_{1}$

## CIRCUIT DIAGRAM :

## PROCEDURE :

1. Connect the circuit as shown in diagram(1).
2. Apply 20V (peak to peak) from the Function Generator.
3. Vary the input frequency in suitable steps (starting from 1 K Hz to 10 K Hz in step of 500 Hz ).
4. Note down the readings of the milli Ammeter for different values of frequency.
5. Calculate the Impedance $Z$.
6. Plot the graphs for current Vs frequency and $Z V$ s frequency.
7. Identify the values of $f_{0}, f_{1}$ and $f_{2}$ from the graph, Calculate the $Q$-factor and Band width.
8. Compare with theoretical values.

## THEORY:

A pair of terminals between which a signal may enter or leave the network is known as port. If a network has only one such pair of terminals, it is known as One-Port Network and those with two ports are known as Two-Port Networks.

Consider a general two-port network composed of linear, bilateral elements and no independent sources.

If we relate the voltage of one port to the current of the same port, we get driving point admittance. On the other hand, if we relate the voltage of one port to the current at another port, we get transfer admittance. Admittance $(=1 / Z)$ is a general term used to represent either the impedance or the admittance of a network.

The voltage and current at port 1 are $\mathrm{V}_{1}$ and $\mathrm{I}_{1}$ and at port2are $\mathrm{V}_{2}$ and $\mathrm{I}_{2}$. The position of $\mathrm{V}_{1}$ and $V_{2}$ and the directions of $I_{1}$ and $I_{2}$ are customarily selected. Out of these four variables, only two are independent variables. The other two are expressed in terms of the independent variable of network parameters. The relation between the voltages and currents in terms of $Z$ and Y parameters are as follows.

$$
\begin{aligned}
& \mathrm{V}_{1}=\mathrm{Z}_{11}\left(\mathrm{I}_{1}\right)+\mathrm{Z}_{12}\left(\mathrm{I}_{2}\right) \\
& \mathrm{V}_{2}=\mathrm{Z}_{21}\left(\mathrm{I}_{1}\right)+\mathrm{Z}_{22}\left(\mathrm{I}_{2}\right) \\
& \mathrm{I}_{1}=\mathrm{Y}_{11}\left(\mathrm{~V}_{1}\right)+\mathrm{Y}_{12}\left(\mathrm{~V}_{2}\right) \\
& \mathrm{I}_{2}=\mathrm{Y}_{21}\left(\mathrm{~V}_{1}\right)+\mathrm{Y}_{22}\left(\mathrm{~V}_{2}\right)
\end{aligned}
$$

## Z-PARAMETERS:

$$
\begin{aligned}
& Z_{11}=V_{1} / I_{1} \text {, for } I_{2}=0 \\
& Z_{22}=V_{2} / I_{2} \text {, for } I_{1}=0 \\
& Z_{12}=V_{1} / I_{2} \text {, for } I_{1}=0 \\
& Z_{21}=V_{2} / I_{1} \text {, for } I_{2}=0
\end{aligned}
$$

## Y-PARAMETERS

$$
\begin{aligned}
& Y_{11}=I_{1} / V_{1}, \text { for } V_{2}=0 \\
& Y_{22}=I_{2} / V_{2}, \text { for } V_{2}=0 \\
& Y_{12}=I_{1} / V_{2}, \text { for } V_{1}=0 \\
& Y_{21}=I_{2} / V_{1}, \text { for } V_{2}=0
\end{aligned}
$$

## PROCEDURE

1. Connections are made as per the circuitdiagram.
2. Open circuit the port -1 i.e., $\mathrm{I}_{1}=0$, find the values of $\mathrm{V}_{1}, \mathrm{I} 2$ and $\mathrm{V}_{2}$.
3. Short circuit the port-1 i.e. $\mathrm{V}_{1}=0$, find the values of $\mathrm{V}_{2}, \mathrm{I}_{1}$ and $\mathrm{I}_{2}$.
4. Open circuit the port -2 i.e., $\mathrm{I}_{2}=0$, find the values of $\mathrm{V}_{1}, \mathrm{I} \operatorname{andV}_{2}$.
5. Short circuit the port-2 i.e. $\mathrm{V}_{2}=0$, measure the values of $\mathrm{V}_{1}, \mathrm{I}_{1} \mathrm{andI}_{2}$.
6. Find the Z and Y parameters of the given two port network

## CIRCUIT DIAGRAMS

## GIVEN CIRCUIT:

3. When $\mathrm{V}_{\mathbf{2}}=0$ :

THEORY:
The relation between the voltages and currents of a two port network in terms of ABCD and $\mathrm{h}-$ parameters is given as follows.

## ABCD PARAMETERS:

$\mathrm{V}_{1}=\mathrm{AV}_{2}-\mathrm{BI}_{2}$
$\mathrm{A}=\mathrm{V}_{2} / \mathrm{V}_{1}, \mathrm{I}_{2}=0$
$B=V_{1} / I_{2}, V_{2}=0$
$\mathrm{I}_{1}=\mathrm{CV}_{2}-\mathrm{DI}_{2}$
$C=I_{1} / V_{2}, I_{2}=0$
$D=I_{1} / I_{2}, V_{2}=0$

HYBRID PARAMETERS
$\mathrm{V}_{1}=\mathrm{h}_{11} \mathrm{I}_{1}+\mathrm{h}_{12} \mathrm{~V}_{2}$

$$
\mathrm{h}_{11}=\mathrm{V}_{1} / \mathrm{l}_{1}, \mathrm{~V}_{2}=0 \quad \mathrm{~h}_{12}=\mathrm{V}_{1} / \mathrm{V}_{2}, \mathrm{l}_{1}=0
$$

$\mathrm{I}_{2}=\mathrm{h}_{21} \mathrm{I}_{1}+\mathrm{h}_{22} \mathrm{~V}_{2}$

$$
h_{21}=I_{2} / l_{1}, V_{2}=0 \quad h_{22}=I_{2} / V_{2}, l_{1}=0
$$

## PROCEDURE:

2. Open circuit the port -1 i.e., $\mathrm{I}_{1}=0$ measure the values of $\mathrm{V}_{1}, \mathrm{I} 2 \operatorname{andV}_{2}$.
3. Short circuit the port-1 $\mathrm{V}_{1}=0$ measure the values of $\mathrm{V}_{2}, \mathrm{I}_{1}$ and $\mathrm{I}_{2}$.
4. Open circuit the port -2 i.e., $\mathrm{I}_{2}=0$ measure the values of $\mathrm{V}_{1}, \mathrm{I} 1$ and $\mathrm{V}_{2}$.
5. Short circuit the port-2 i.e. $\mathrm{V}_{2}=0$ measure the values of $\mathrm{V}_{1}, \mathrm{I}_{1} \operatorname{and} \mathrm{I}_{2}$
6. Measure the ABCD and h -parameters of the given two port network from the above data.

## To find Rth

Figure 3 measurement of Rth

Thevinen's Equivalent circuit:

Figure. 4 measurement of load current

THEORY:

Any linear, bilateral network having a number of voltage, current sources and resistances can be replaced by a simple equivalent circuit consisting of a single voltage source in series with a resistance, where the value of the voltage source is equal to the open circuit voltage and the resistance is the equivalent resistance measured between the open circuit terminals with all energy sources replaced by their ideal internal resistances

Measurement of $I\left\llcorner \& V_{\text {TH }} O V_{\text {oc }}\right.$ Measurement ofR ${ }_{\text {TH }}$

$$
\text { Measurement of } I_{L}\left(I_{L}=V_{T H} \text { or } V_{O C} / R_{T H}+R_{L}\right)
$$

## PROCEDURE:

1. Connect the circuit diagram as shown infig.. 1
2. Measure current in $\mathrm{R}_{\mathrm{L}}$.
3. Connect the circuit as shown infig.2.
4. Measure open circuit voltage $\mathrm{V}_{\mathrm{oc}}$ by open circuiting terminals i.e., $\mathrm{V}_{\mathrm{TH}}$
5. Connect the circuit as shown infig.3,measure equivalent resistance i.e. $\mathrm{R}_{\mathrm{th}}$
6. Connect the Thevinen's equivalent circuit as shown infig. 4
7. Measurement current inR $\mathrm{L}_{\mathrm{L}}$

TABULARCOLUMN:

| Parameters | Theoretical Values | Practical Values |
| :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{Oc}}$ |  |  |
| $\mathrm{R}_{\mathrm{TH}}$ |  |  |
| $\mathrm{I}_{\mathrm{L}}$ |  |  |

PRECAUTIONS:

1. Check for proper connections before switching ON thesupply
2. Make sure of proper color coding ofresistors
3. The terminal of the resistance should be properlyconnected.

RESULT:

VIVAQUESTIONS:

1. What is load resistance?
2. How will you calculate Thevinen's resistance $\mathrm{R}_{\mathrm{TH}}$ ?
3. How will you calculate Thevinen's voltage $\mathrm{V}_{\mathrm{TH}}$ ?
4. How will you calculate load current $\mathrm{I}_{\mathrm{L}}$ ?

## B.VERIFICATION OF NORTON 'S THEOREM

## AIM:

To Verify Norton's theorem.

## Apparatus Required

| Sl.No. | Apparatus | Range | Quantity |
| :--- | :--- | :--- | :--- |
| 1 | RPS (regulated power supply) | $(0-30 \mathrm{~V})$ | 2 |

## Norton's equivalent circuit

Figure. 4 measurement of load current

## STATEMENT

Any linear, bilateral network with current sources, voltage sources and resistances can be replaced by an equivalent circuit consisting of a current source in parallel with a resistance. The value of the current source is the current flowing through the short circuit terminals of the network and the resistance is the equivalent resistance measured between the open circuit terminals of the network with all the energy

sources replaced by their internal resistances.

Norton's
Norton's
EquivalentResistancecircuit

Norton's Current EquivalentCircuit

## PROCEDURE:

1.Connect the circuit diagram as shown in fig. 1 .
2.Measure the current $I_{L}$
3.Connect the circuit diagram as shown in fig. 2
4.Measure the current Isc (or) IN by short-circuiting load resistance
5.Connect the circuit diagram as shown in fig. 3
6.Remove RPS and short circuit the terminal and remove the load and note down the resistance across the two terminals.
7.Connect Norton's equivalent circuit by connecting IN \& RN in parallel as shown in fig. 4 and find load current.

## TABULARCOLUMN:

| Parameters | Theoretical Values | Practical Values |
| :--- | :--- | :--- |
| Isc/ IN |  |  |
| RN |  |  |
| IL |  |  |

VIVAQUESTIONS:

1. What is load resistance?
2. How will you calculate Norton's resistance $\mathrm{R}_{\mathrm{N}}$ ?
3. How will you calculate Norton's currentIsc?
4. How will you calculate load current $\mathrm{I}_{\mathrm{L}}$ ?

| 4 | DRB | -- | 1 |
| 5 | Bread Board $\&$ <br> wires | -- | Required |

CIRCUITDIAGRAM:

Fig -. 1 Maximum Power Transfer Circuit

## STATEMENT:

The maximum power transfer theorem states that maximum power is delivered from a source to an load resistance when the load resistance is equal to source resistance. ( $R L=R_{s}$ is the condition required for maximum power transfer).

PROCEDURE:

1. Connect the circuit as shown infig.. 1
2. Vary the load resistance in steps and note down current flowing through thecircuit.
3. Calculate power delivered to the load
4. Draw the graph between resistance and power (resistance on X - axis and power onY-axis).
5. Verify the maximum power is delivered to the load when $\mathrm{RL}=\mathrm{Rs}$ forDC.

2. Make sure of proper color coding ofresistors
3. The terminal of the resistance should be properlyconnected

RESULT:

## VIVAQUESTIONS:

1. State maximum power transfertheorem.
2. Is it possible to apply maximum power transfer theorem to ac as well as dccircuit?
3. How to find power using maximum power transfertheorem?
4. What are conditions for maximum power transfertheorem?
5. Is itpossible to apply maximumpower transfertheoremto nonlinearcircuit?

## EXP:8

## Measurement of active, reactive power using two watt meter method

AIM

To conduct a suitable experiment on a 3-phase load connected in star or delta to measure the three phase power and power factor using 2 wattmeter method.

## OBJECTIVES

1. To study the working of wattmeter
2. To accurately measure the 3 phase power
3. To accurately measure the power factor
4. To study the concept of star connected load and delta connected load

## APPARATUS REQUIRED:

| S.NO | NAME OF THE APPRATUS | RANGE | TYPE | QTY |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | Ammeter |  |  |  |
| $\mathbf{2}$ | Voltmeter |  |  |  |
| $\mathbf{3}$ | Wattmeter |  |  |  |
| $\mathbf{4}$ | Connecting Wires |  |  |  |
| $\mathbf{5}$ | 3phase inductive load |  |  |  |

FORMULA USED:

1. Total power, $P=W_{1}+W_{2}$ (W)
2. $\varnothing=\tan ^{-1} \sqrt{ } 3\left[\left(\mathrm{~W}_{1}-\mathrm{W}_{2}\right) /(\mathrm{w} 1+\mathrm{w} 2)\right]$
3. P.F $=\operatorname{Cos} \varnothing$
4. Reactive Power $=\sqrt{ } 3\left(W_{1}-W_{2}\right)($ VAr $)$

## PROCEDURE:

1. Connection are made as per the circuit diagram, keeping the inductive load in the minimum position.
2. Supply switch is closed and reading of ammeter and wattmeter are noted.If one of the

Wattmeter reads negative, then its potential coils ( C and V ) are interchanged and reading is taken as negative.
3. The above procedure is repeated for different values of inductive coil. Care should be taken that current should not exceed 10A during the experiment.

TABULAR COLUMN:

| S.NO | I | V | W1 | W2 | POWER | REACTIVE <br> POWER | PF |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  |  |  |  |  |

| 3 |  |  |  |  |  |  |  |
| 4 |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |
| 6 |  |  |  |  |  |  |  |

## RESULT:

VIVA QUESTIONS

1. Which method is the commonest method of measuring three balanced or unbalanced power?
2. The reactive power can be measured with wattmeter when voltage across voltage coil is adjusted to be out of phase with the current by $\qquad$
3. The total power P measured in Y star three-phase circuit is
4. The power in delta three-phase circuit is
5. The dynamometer wattmeter can be used to measure----- POWER
6. Induction wattmeter can be used to measure--- power
7. The one "unit" of energy measured in AC circuit is
8. How do you calculate Real Power, Reactive power and Apparent power, given $\mathrm{W}_{1}$ and $\mathrm{W}_{2}$ ?

## EXP:9

## Simulation and transient analysis of series RLC circuits

 AIM:To plot the magnitude curve for various frequencies for the given RLC series circuit.

## SOFTWARE REQUIRED:

| S. No | SOFTWARE USED | DESK TOP <br> QUANTITY |
| :---: | :--- | :---: |
| 1 | MATLAB | 01 |

## THEORY:

A circuit is said to be in resonance when applied voltage V and current I are in phase with each other. Thus at resonance condition, the equivalent complex impedance of the circuit consists of only resistance (R) and hence current is maximum. Since V and I are in phase, the power factor is unity.

The complex impedance
$Z=R+j(X L-X C)$
Where XL
$=\omega \mathrm{LXC}=$
$1 / \omega \mathrm{C}$
At resonance, $\mathrm{XL}=\mathrm{XC}$ and hence $\mathrm{Z}=\mathrm{R}$

## Bandwidth of a Resonance Circuit:

Bandwidth of a circuit is given by the band of frequencies which lies between two points on either side of resonance frequency, where current falls through $1 / 1.414$ of the maximum value of resonance. Narrow is the bandwidth, higher the selectivity of the circuit. As shown in the model graph, the bandwidth $A B$ is given by $\mathrm{f} 2-\mathrm{f} 1$. f 1 is the lower cut off frequency and f 2 is the upper cut off frequency

## CIRCUIT DIAGRAM:

Fig - Series Resonance simulation diagram

## PROCEDURE:

1. Open a new MATLAB/SIMULINK model
2. Connect the circuit as shown in the figure 12.3
3. Debug and run the circuit
4. By double clicking the powergui plot the value of current for the different values of frequencies
